

ATI AMD Radeon 5450 fixed graphics kexts for hackintosh mountaion lion

By: *Alok Yadav* ON : 13 September, 2012 In: *Tutorial* 102 Comments

This Post Is Older Than 6 Or More Months , Please Use These Tips Carefully .

In this tutorial i will show you how to get working hackintosh graphics in mountain lion with Full resolution and QI/CE

previously i posted patched kext for lion 10.7.4 and this time this is for mountain lion 10.8.1 and laterafter installing everything , i am assuming that you already installed boot-loader and other kexts if you dont you should install them first, for more on installation guides see <http://www.tonymacx86.com> and get back here when you install everything except graphicsTESTED ON : Mountaion Lion 10.8.1

NOTE : I do not issue any guarantee that this will work for you! use

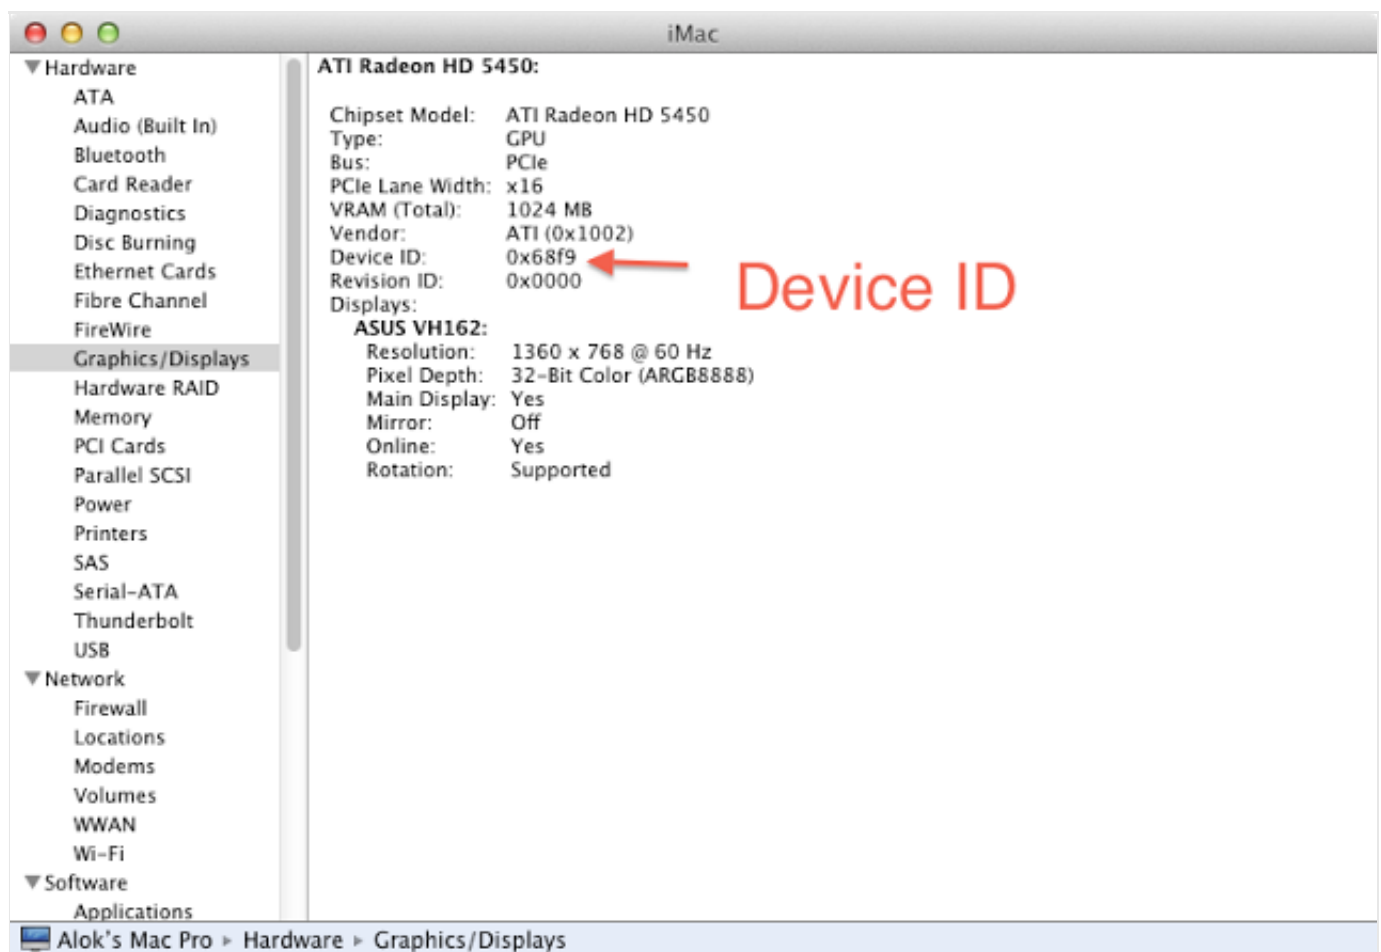

google for other troubleshooting

STEPS : 1 : Open Terminal and paste these commands to ShowAll Files

```
$defaults write com.apple.finder AppleShowAllFiles  
TRUE  
$killall Finder
```

2 : Figure out your graphics device ID

- about this mac
- more info
- system report
- click on graphics/displays from left sidebar

3 :Add your Device ID to ATi5000controller.kext and AMDRadeonAccelerator.kext.

4: delete all ATI and AMD related Kexts and injectors EXCEPT these 5 :

1. ATIFramebuffer.kext
2. ATIRadeonX3000GLDriver.bundle
3. ATi5000Controller.kext
4. AMDRadeonAccelerator.kext
5. ATISupport.kext

or just copy and save all ATI and AMD related kext to somewhere and delete from S/L/E then download and install these patched kexts

[Download kexts](#)

Another Patched Kexts if first doesn't work for you (10.8.2 version)

5 : set GraphicsEnabler = Yes

6 : Repair permission through kext utility

7 : reboot
